1 Introduction and statement of the results

In this paper we shall consider the Cauchy problem

\begin{equation}
\Box u = F(u, u') \text{ if } x \in \mathbb{R}, \ t > 0,
\end{equation}

\begin{equation}
(\partial^2_t u)(x, 0) = \psi_j(x), \ j = 0, 1, \text{ if } x \in \mathbb{R},
\end{equation}

where $\Box = \partial_x^2 - \partial_t^2$ is the d'Alembertian, $F \in C^1(\mathbb{R} \times \mathbb{R}^2)$, $u' = (\partial_x u, \partial_t u)$, and $\psi_j \in C^{2-j}(\mathbb{R})$, $j = 0, 1$. We shall put $\mathbb{R}^+ = \{s \in \mathbb{R}, s > 0\}$, $\mathbb{R}^+ = \{s \in \mathbb{R}, s > 0\}$. It is well known and easy to verify that one can find an open neighborhood $V$ of $\mathbb{R} \times \{0\}$ in $\mathbb{R} \times \mathbb{R}^+$ such that (1.1), (1.2) has a (unique) $C^2(V)$ solution. To be more precise, if $x \in \mathbb{R}$ and $t > 0$, put $K^-(x, t) = \{(y, s) \in \mathbb{R} \times \mathbb{R}^+, s < t, |x - y| < t - s\}$. If $\mathcal{U}$ is an open subset of $\mathbb{R} \times \mathbb{R}^+$, one says that $\mathcal{U}$ is an influence domain if for any $(x, t) \in \mathcal{U}$, one has $K^-(x, t) \subset \mathcal{U}$. Let $\Omega$ be the union of all influence domains containing $\mathbb{R} \times \{0\}$ in which (1.1), (1.2) has a (unique) $C^2$ solution. Then $\Omega$ is the maximal influence domain with that property. One can check that, for all $x \in \mathbb{R}$, $\{t > 0, \{x\} \times [0, t] \subset \Omega\} \neq \emptyset$. Put $\varphi(x) = \sup\{t > 0, \{x\} \times [0, t] \subset \Omega\}$. Then either $\varphi \equiv +\infty$ or $\varphi$ is everywhere finite and $|\varphi(x) - \varphi(y)| \leq |x - y|$ for all $x, y \in \mathbb{R}$. In [2], [3], under suitable assumptions on the initial data, a study was made of the case that $F(z, (p, q))$ is independent of $(p, q)$, behaves like $z^r$, $r > 1$, as $z \to +\infty$, and is bounded below as $z \to -\infty$. When
